

## Unit 10 Notes

## Vocabulary

Vocabulary Term	Definition	Example
altitude	in a geometrical figure, the perpendicular distance from the vertex to the plane of the base	See illustrations of each three-dimensional figure
Cone	an object or shape that has a circular base and tapers to a point at the top, or has a circular top and tapers to a point at the bottom	See oblique and right cone
*Altitude of a cone	The perpendicular distance from the vertex of the cone to the circular base	
*Axis of a cone	the line containing the <a href="#">vertex</a> of a <a href="#">conic solid</a> and the center of the <a href="#">base</a>	
*Oblique cone	<p>A non-right cone</p> <ul style="list-style-type: none"> <li>• Is there a slant height for an oblique cone?</li> <li>• Explain.</li> <li>• Does it have an axis?</li> <li>• Explain.</li> </ul>	
*Right cone	a cone whose axis is perpendicular to the plane containing its base	
*Slant height of a right cone	The distance from the edge of the base to the vertex	
*Vertex of a cone	The point that marks the thinnest part of a cone. It is opposite the base of the cone.	

<p>Cross-section of a polygon</p>	<p>A cross-section of a space figure is the shape of a particular two-dimensional "slice" of a space figure.</p>	
<p>Cube</p>	<p>A six sided polyhedron whose faces are all squares. It has 6 faces, 12 vertices, and 18 edges.</p>	
<p>Cylinder</p> <ul style="list-style-type: none"> <li>• Axis of a Cylinder</li> <li>• Right Cylinder</li> </ul>	<p>A three-dimensional figures with two circular or oval bases whose net contains a rectangle.</p> <p>A line connecting the centers of the bases of a cylinder</p> <p>A cylinder whose axis is perpendicular to both bases.</p>	 <p>Right cylinder</p>
<p>Diagonal of a Right Prism</p>	<p>A segment whose endpoints are vertices of two different faces</p>	
<p>Distance formula for 3-D figures</p>	<p>The length of a diagonal of a prism is</p>	$d = \sqrt{l^2 + w^2 + h^2}$
<p>Edge of a 3-D figure</p>	<p>The segment that intersects two faces of a polyhedron.</p>	 <p>edge edge edge edge edge</p> <p>A pentagon pyramid has 10 edges</p> <p>a cube has 12 edges</p> <p>a cylinder has two edges</p>

*Lateral Edge of a polyhedron	The segment that connects the vertices of the bases to form the sides	
Euler's Formula	For any polyhedron with V vertices, F faces and E edges,	$V - E + F = 2.$
Face of a polyhedron	The polygons that form the sides and bases of a polyhedron	
*Lateral face of a polyhedron	The polygons that form the sides of a polyhedron	
Isometric Drawing	A way to show three sides of a figure from a corner view.	
Orthographic Drawing	A drawing that shows a three-dimensional object in which the sight for each view is perpendicular to the plane of the picture. It shows 6 different views of the object: front, back, top, bottom, left side, and right side	
Midpoint Formula for 3-D figures	$\left(\frac{\Delta x}{2}, \frac{\Delta y}{2}, \frac{\Delta z}{2}\right)$	
Perspective Drawing	Non-vertical parallel lines are drawn so that they meet at the vanishing point	
Polyhedron	A closed three-dimensional figure formed by 4 or more polygons that intersect only at their edges	
Prism	A polyhedron with rectangular sides and two congruent bases.	
<ul style="list-style-type: none"> <li>Oblique Prism</li> </ul>	A prism that has at least one nonrectangular lateral face	
<ul style="list-style-type: none"> <li>Right Prism</li> </ul>	A prism whose lateral faces are all rectangles.	
Pyramid	A polyhedron with one polygonal base and triangular sides that meet at a common vertex.	

*Regular pyramid	A pyramid whose base is a regular polygon and whose lateral faces are isosceles triangles	
*Slant height of a regular pyramid	The distance from the vertex of a regular pyramid to a midpoint of an edge of the base	
*Vertex of a pyramid	The point of intersection of the lateral faces of a pyramid. It is opposite to the base of the pyramid.	
Sphere		
*Surface Area of a sphere	The formula for finding the surface area of a sphere is	$S = 4\pi r^2$
*Volume of a sphere	The formula is	$V = \frac{4}{3}\pi r^3$
*Lateral Surface Area	The sum of the areas of the sides of a polyhedron. Formulas are at the right, P is the perimeter, C is the circumference, height is the height and l is the slant height.	Lateral Surface area of a prism = Ph Lateral Surface area of a pyramid = $\frac{1}{2} Pl$ Lateral Surface area of a cylinder = Ch Lateral surface area of a cone = $\frac{1}{2} Pl$
Vanishing Point	A point where lines meet on the horizontal line called the horizon	
Vertices of a polyhedron	The point where three faces meet.	

Volume	The number of non-overlapping unit cubes that will exactly fill the interior of a three-dimensional figure	<p><math>V = Bh</math>, where <math>B</math> is the area of the base and <math>h</math> is the altitude of the figure.</p> <p><math>V_{\text{cube}} = s^3</math> because the area of the base is <math>s^2</math> and the height is <math>s</math>.</p> <p><math>V_{\text{cylinder}} = \pi r^2 h</math> because the area of a circle is <math>A = \pi r^2</math></p> <p><math>V_{\text{cone}} = 1/3 \pi r^2 h</math> because a cone is <math>1/3</math> of a cylinder.</p> <ul style="list-style-type: none"> <li>• The volume of any prism is found by multiplying the area of its base by its height.</li> <li>• The volume of a pyramid is found by taking <math>1/3</math> the area of the base times its height.</li> </ul>
